# World Agricultural Production

## Argentina Wheat: Record Yield and Production

USDA estimates Argentina wheat production for marketing year (MY) 2025/26 at a record 24.0 million metric tons, up 9 percent from last month and 30 percent from last year. Wheat yield is estimated at a record 3.69 tons per hectare, up 6 percent from last month, and 26 percent from last year. Harvested area is estimated at 6.5 million hectares, up 3 percent from last month, and 3 percent from last year.

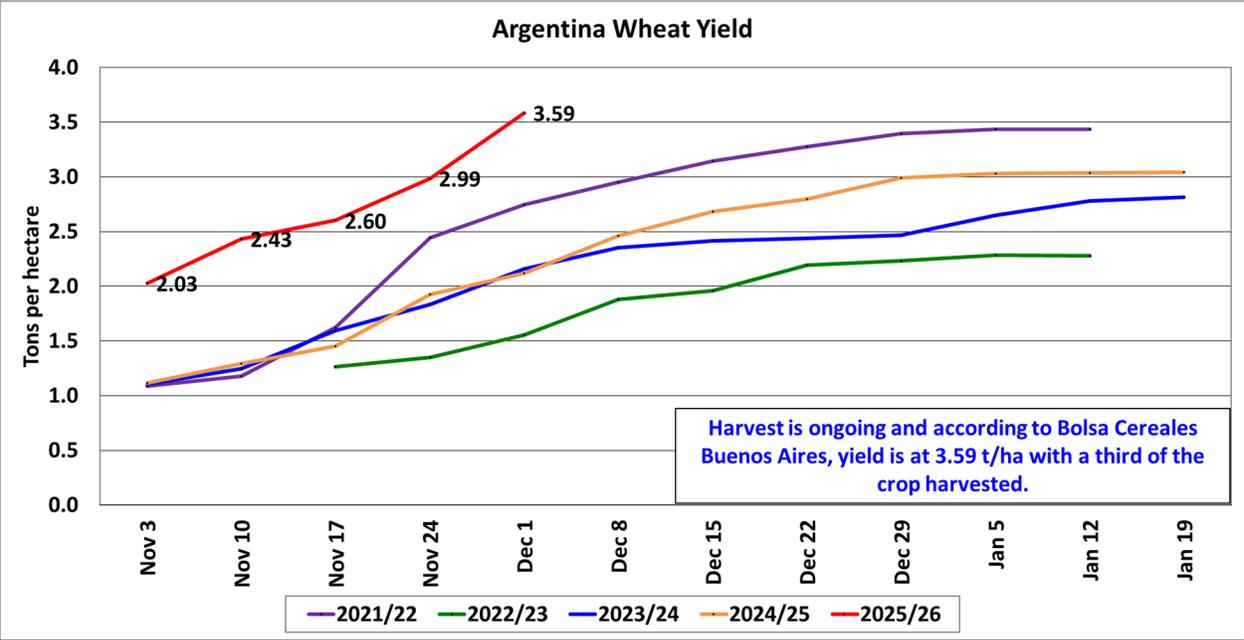

### MODIS NDVI: Buenos Aires, Córdoba, Santa Fe

Source: MODIS NDVI (Terra 8-day 250m) from the operational USDA/NASA Global Agricultural Monitoring (GLAM) system; ESA WorldCover 2020 crop mask

Wheat in Argentina is planted in May through July and harvested in November through January. Wheat typically flowers in September in the northern regions and October in the southern regions. During September, above-average rainfall occurred during the critical flowering stage throughout the entire wheat belt provinces of Buenos Aires (which accounts for about 50 percent of production), Córdoba (13 percent), and Santa Fe (18 percent). During October, there was again above-average rainfall in the southern regions of Buenos Aires province during the crop's flowering stage. Crop conditions during the growing season have been significantly above average, as shown by the satellite-derived Normalized Difference Vegetation Index (NDVI).

Approved by the World Agricultural Outlook Board

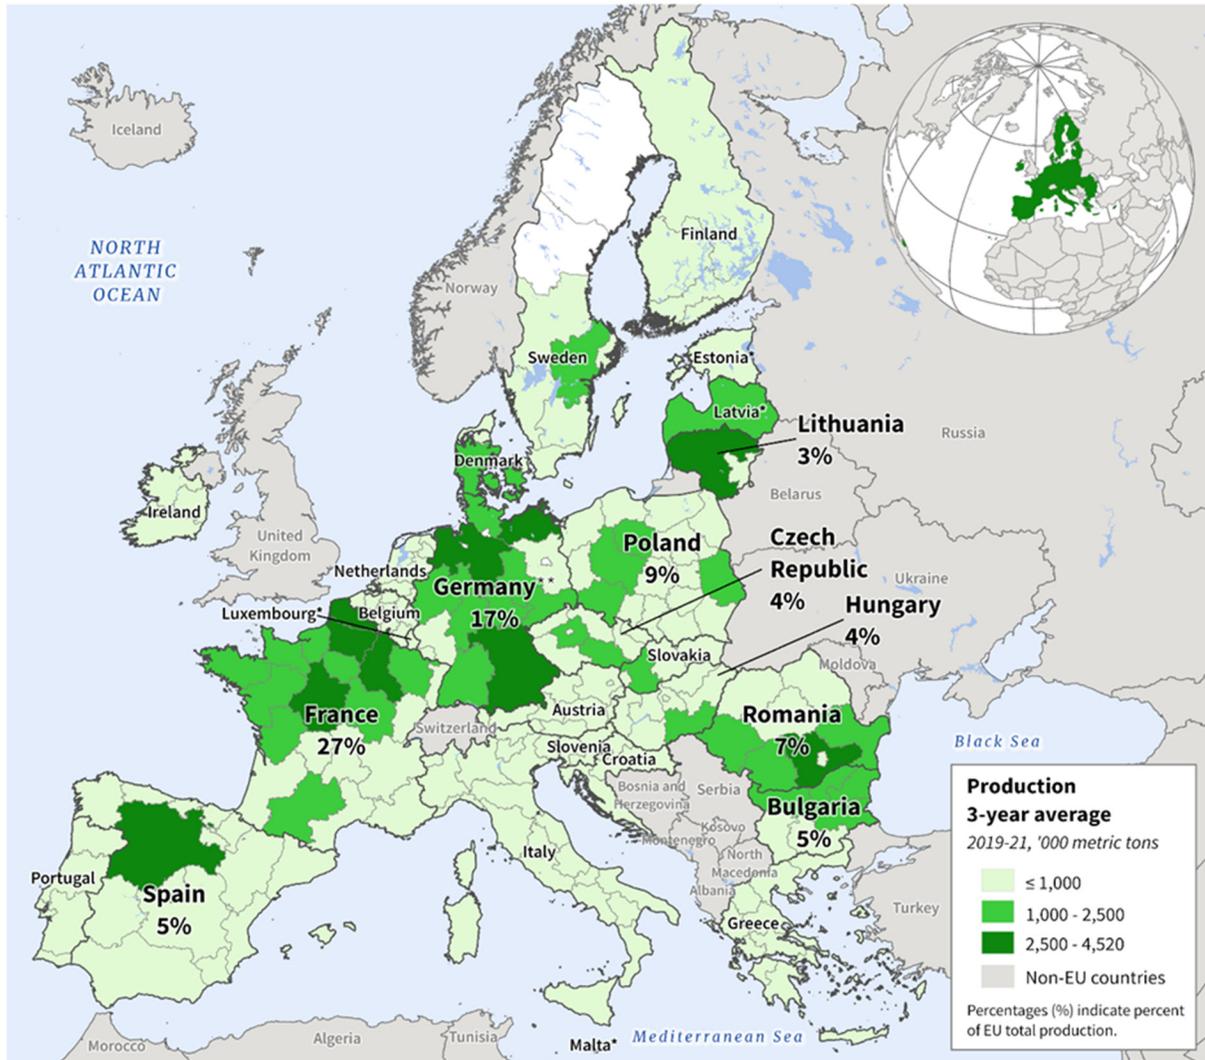

Source: Bolsa Cereales Buenos Aires

Harvest is ongoing and, as of the end of November, harvest progress is about a third complete. Early harvest results from official and industry sources corroborate the above-average yield. (For more information, please contact [Katie.McGaughey@usda.gov](mailto:Katie.McGaughey@usda.gov).)

**European Union Wheat: Record Yields Deliver Bumper Crop**

USDA estimates marketing year (MY) 2025/26 wheat production in the European Union (EU) at 144.0 million metric tons, up 1 percent from last month, 18 percent from last year, and 10 percent from the 5-year average. Harvested area is estimated at 24.0 million hectares, up less than 1 percent from last month, 5 percent from last year, and 1 percent above the 5-year average. Yield is estimated at a record 6.01 tons per hectare, up 1 percent from last month, 12 percent from last year, and 9 percent above the 5-year average.

## European Union (EU): Wheat Production

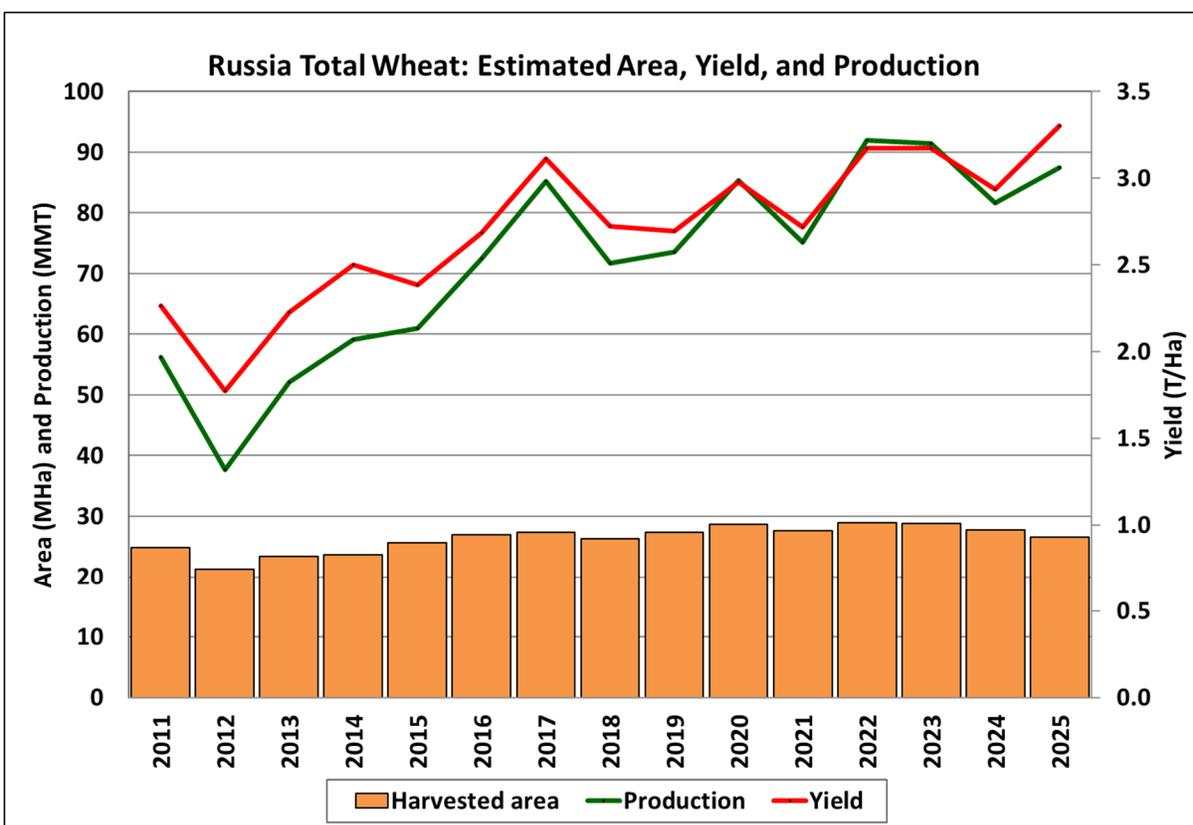

Source: Eurostat by Nomenclature of Territorial Units for Statistics (NUTS) 2 region, with exceptions indicated by \* (NUTS 0/country-level data), or \*\* (NUTS 1 region)

Based on the latest information from individual member country harvest reports, estimates were revised upward. Record wheat yields within the EU bolstered the aggregate production, now matching the record reached in MY 2015/16. Beneficial spring conditions, including favorable early-season rains and mild non-damaging temperatures, boosted harvest results. Positive growing conditions were widespread during spring, including the major producers such as France, up 28 percent from last year, Germany up 26 percent from last year, and Romania, up 32 percent from last year. While dry conditions overspread the region during summer, impacts to the wheat crop were negligible.

For country-specific area, yield, and production estimates within the EU, please go to PSD Online at <https://apps.fas.usda.gov/PSDOnline/app/index.html#/app/home>, and select “Downloadable Data Sets.” Select the zipped file for “EU Countries Area & Production.” (For more information, please contact [Bryan.Purcell@usda.gov](mailto:Bryan.Purcell@usda.gov).)

## Russia Wheat: Production Up Based on Official Data

USDA estimates Russia wheat production for marketing year 2025/26 at 87.5 million metric tons (mmt), up 1 percent from last month and 7 percent from last year. The estimate includes 61.5 mmt of winter wheat and 26.0 mmt of spring wheat. USDA crop production estimates for Russia exclude output from Crimea. Total wheat yield is estimated at a record 3.30 tons per hectare (t/ha), up 1 percent from last month and 12 percent from last year. Total harvested area is estimated at 26.5 million hectares (mha), unchanged from last month and down 5 percent from last year.

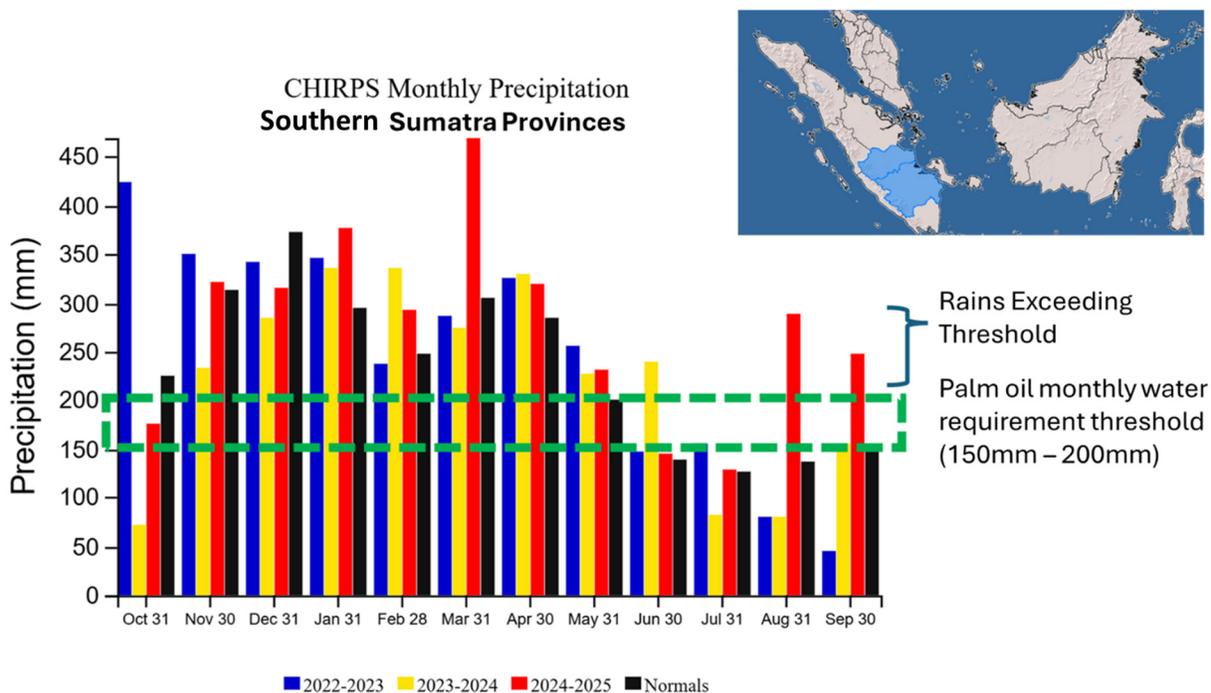

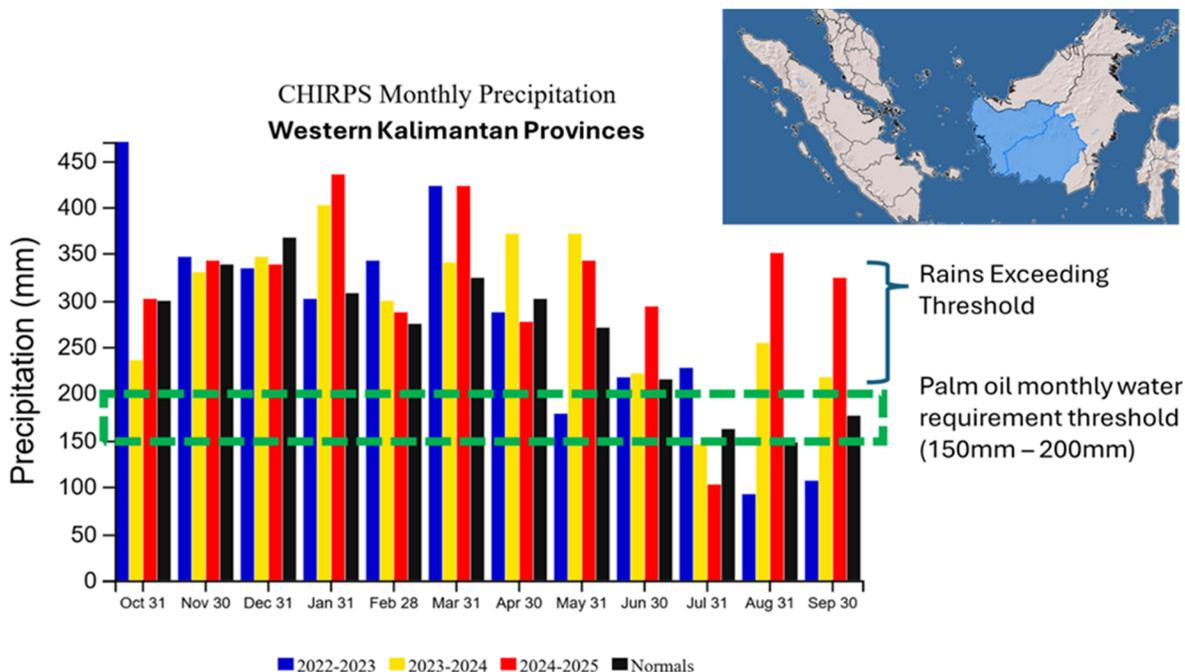

Source: USDA PSD Online

The month-to-month increase in production is based on official harvest data released by the Ministry of Agriculture (MinAg) of Russia. According to MinAg, harvest is complete. As of late November, 91.6 mmt of total wheat in bunker weight has been harvested from an area of 26.5 mha (including Crimea). Assuming normal net-to-bunker conversion of 97 percent (representing the 5-year average), current net yield is about 3.36 t/ha excluding Crimea. Overall favorable weather throughout all spring wheat growing regions ensured a record yield this season. The optimal yield of the spring crop allowed offsetting the reduction in wheat planted area this season and ensured a year-over-year production increase.

Area, yield, and production estimates for Russia winter wheat and spring wheat are available on PSD Online. Select “Downloadable Data Sets” and open the zipped file for “Russia Wheat; Winter/Spring Area & Production” (For more information, please contact [Iliana.Mladenova@usda.gov](mailto:Iliana.Mladenova@usda.gov).)

## Indonesia Palm Oil: MY 2024/25 Production Revised Downward Due to Adverse Late Season Rains

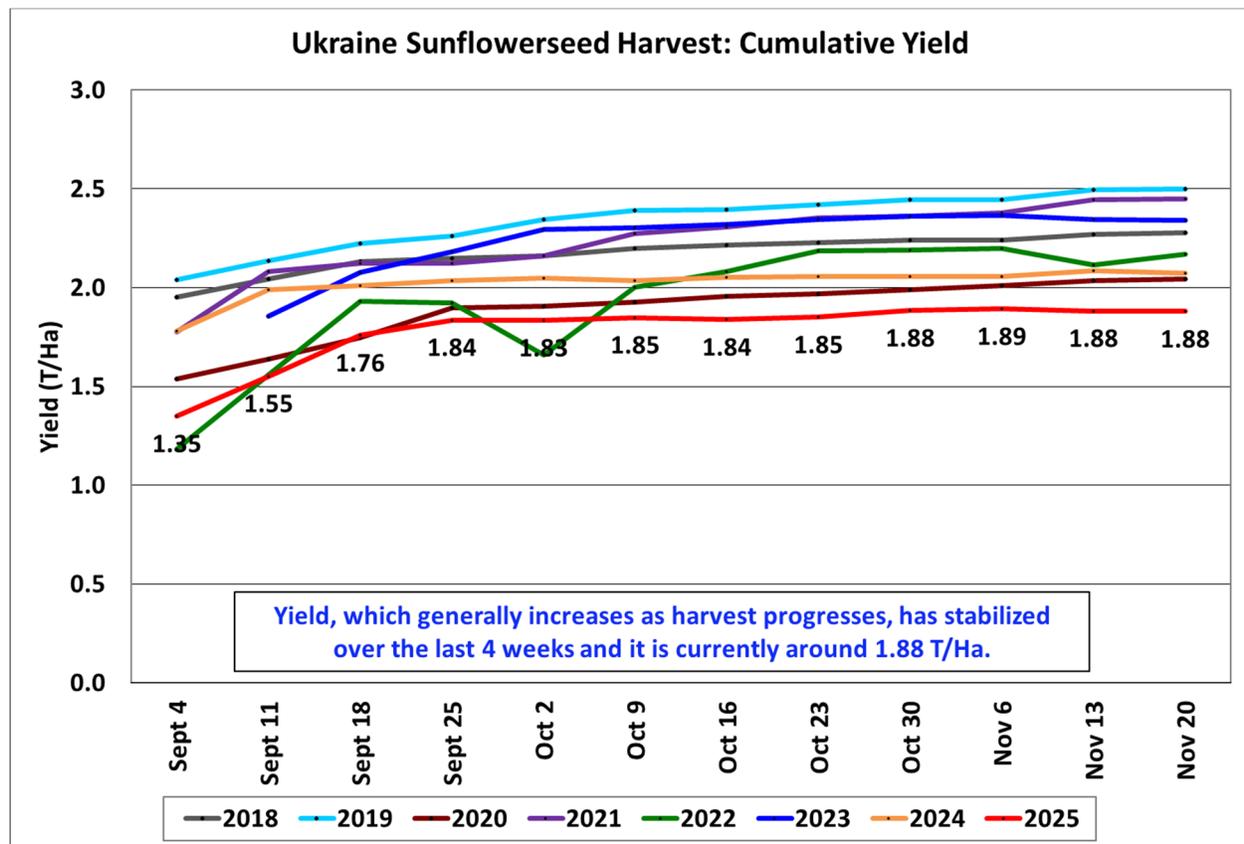

USDA estimates marketing year (MY) 2024/25 Indonesia palm oil production at 45.5 million metric tons, down 1 percent from last month, but up 6 percent from MY 2023/24. Harvested area is estimated at 14.0 million hectares, unchanged from last month, but up 4 percent from MY 2023/24. Yield is estimated at 3.25 tons per hectare, down 1 percent from last month, but up 2 percent from MY 2023/24.

Persistent rainfall during August and September 2025 hampered palm oil harvest and logistics operations in southern Sumatra and western Kalimantan provinces. These two regions represent more than 40 percent of Indonesia’s total palm oil output. The monthly rainfall requirement for palm oil to yield favorably is between 150 millimeters and 200 millimeters. Monthly rainfall observations for the months of August and September exceeded the threshold by nearly 100 millimeters in both consecutive months. As a result, localized flooding led to a disruption of harvest and logistical operations. Harvest-ready palm oil (fruit bunches) must be processed within 24 hours to achieve optimal yield performance. When disruptions to harvest operations occur, thus elongating the process time, yields are negatively impacted. USDA’s marketing year for Indonesia palm oil begins in October and ends in September. *(For more information, please contact [Justin.Jenkins@usda.gov](mailto:Justin.Jenkins@usda.gov).)*

### Ukraine Sunflowerseed: Area and Yield Down Based on Official Data

USDA estimates Ukraine sunflowerseed production for marketing year (MY) 2025/26 at 10.5 million metric tons (mmt), down 13 percent from last month and 19 percent from last year. Yield is estimated at 1.88 tons per hectare (t/ha), down 9 percent from last month and 13 percent from last year. Harvested area is estimated at 5.6 million hectares (mha), down 3 percent from last month and 7 percent from last year.

Source: Ukraine Ministry of Agriculture

At present, Ukraine can be divided into two zones, areas in conflict and areas not in conflict. As elaborated by FAS/Kyiv in Ukraine, due to the ongoing war there is no official and reliable information about the status of Ukraine's agriculture in the conflict zone. As a result, area and production data currently provided by FAS/Kyiv, Ukraine's Ministry of Agriculture (MinAg), and the State Statistical Service of Ukraine, which inform USDA's forecasts, do not reflect the whole country. MinAg also does not include Crimea. USDA crop production estimates for Ukraine include estimated output from Crimea. Crimean area and production numbers are extracted from the agricultural crop reports provided by the Russian Statistical Agency, Rosstat.

This month's downward yield and area revisions are based on official harvest data released by MinAg. As of November 27, approximately 9.0 mmt of sunflowerseed have been threshed from 4.8 mha. Harvest is wrapping up and yield has stabilized around 1.88 t/ha, down relative to last year during the same time of the campaign when yield was around 2.08 t/ha. Persistent below-average precipitation and early-to-mid July heat caused a widespread soil moisture deficit predominantly across the Steppe zone, which accounts for about 60 percent of Ukraine's total sunflowerseed production. Thus, MinAg's harvest results are in line with the overall challenging growing conditions this season.

As a reminder, USDA crop production estimates for Ukraine include estimated output from Crimea. *(For more information, please contact [Iliana.Mladenova@usda.gov](mailto:Iliana.Mladenova@usda.gov).)*

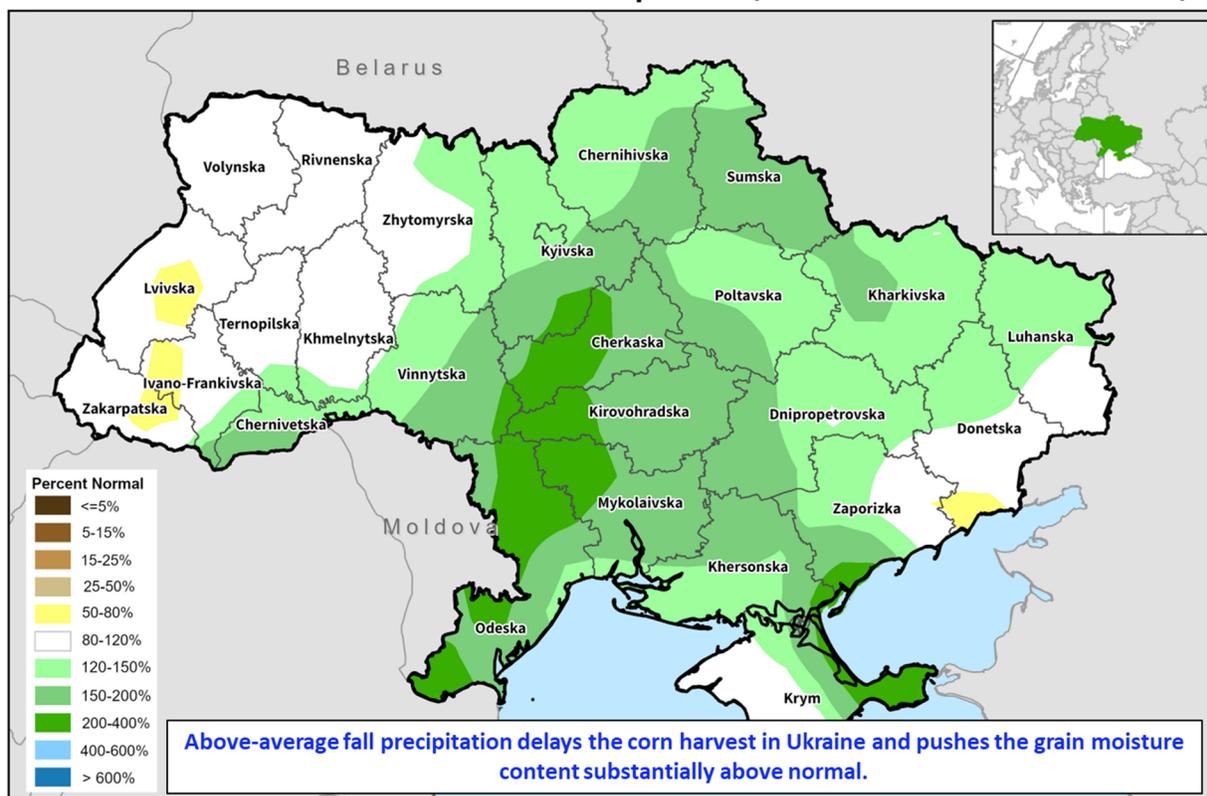

### **Ukraine Corn: Poor Weather Conditions Slow Harvest**

USDA estimates Ukraine corn production for marketing year (MY) 2025/26 at 29.0 million metric tons (mmt), down 9 percent from last month, but up 8 percent from last year. Yield is estimated at 6.90 tons per hectare (t/ha), down 5 percent from last month, but up 6 percent from last year. Harvested area is estimated at 4.2 million hectares (mha), down 5 percent from last month, but up 2 percent from last year.

At present, Ukraine can be divided into two zones, areas in conflict and areas not in conflict. As elaborated by FAS/Kyiv in Ukraine, due to the ongoing war there is no official and reliable information about the status of Ukraine's agriculture in the conflict zone. As a result, area and production data currently provided by FAS/Kyiv, Ukraine's Ministry of Agriculture (MinAg), and the State Statistical Service of Ukraine, which inform USDA's forecasts, do not reflect the whole country. MinAg also does not include Crimea. USDA crop production estimates for Ukraine include estimated output from Crimea. Crimean area and production numbers are extracted from the agricultural crop reports provided by the Russian Statistical Agency, Rosstat.

This month's area and yield revisions are based on official data provided by MinAg. As of November 27, farmers harvested 22.5 mmt of corn from 3.3 mha. This season's growing conditions were normal in the northern part of Ukraine, but heat and dryness hampered crop development across the more southern corn regions of the country. The MinAg reported a yield of 6.79 t/ha, which is in line with this season's growing conditions.

## Ukraine: Percent of Normal Cumulative Precipitation (October 1 – November 30, 2025)

Source: NOAA CPC

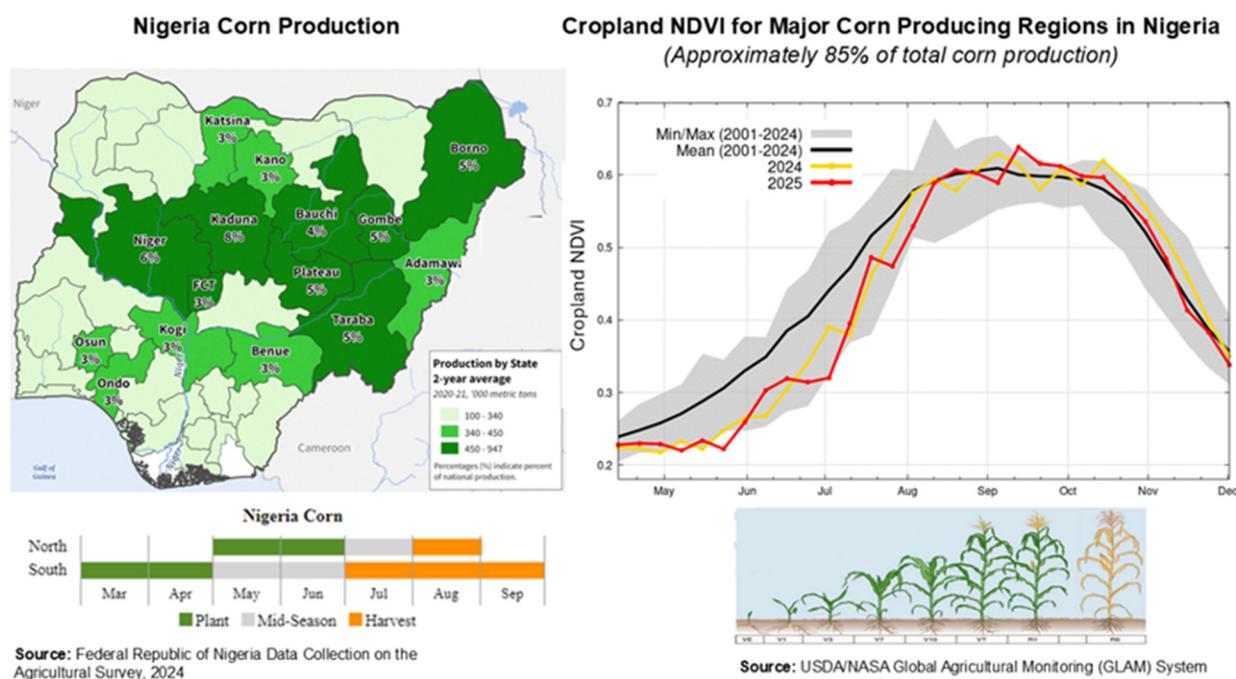

At present, corn harvest is about 75 percent complete, which is behind last year (93 percent) and the average (87 percent) during the same time of the campaign. Open-source articles report that the biggest delays are in the northern and western regions of the country. As explained by FAS/Kyiv, the main reason for the delay is high corn kernel moisture content. Wet fall weather caused increased soil moisture content and atmospheric humidity, preventing the corn crop from drying in the field. As elaborated by FAS/Kyiv, currently corn is delivered to the elevators with 32-35 percent moisture as opposed to the normal starting point of 20-23 percent. Removing the excessive moisture requires a longer drying process, which in turn increases the farmers' costs and slows the elevators' capabilities to accept new deliveries. In addition, the increased grain moisture poses a risk of the development of mycotoxins. Recently the weather has improved, allowing harvest to partially advance, however, a portion of this season's crop might be left to dry in the field over winter and harvested in the spring.

USDA crop production estimates for Ukraine include estimated output from Crimea. *(For more information, please contact [Iliana.Mladenova@usda.gov](mailto:Iliana.Mladenova@usda.gov).)*

## Nigeria Corn: Production Slightly Up from Last Year

USDA estimates Nigeria corn production for marketing year (MY) 2025/26 at 11.4 million metric tons, down 5 percent from last month, but up 2 percent from last year. Harvested area is estimated at 5.2 million hectares, down 10 percent from last month, but up 3 percent from last year and 9 percent lower than the 5-year average. Yield is estimated at 2.20 metric tons per hectare, down 1 percent from last year and 4 percent above the 5-year average. Continued conflict in the northern region discouraged farmers from planting corn this year, while high fertilizer costs and low prices at the time of planting also lowered planting intentions.

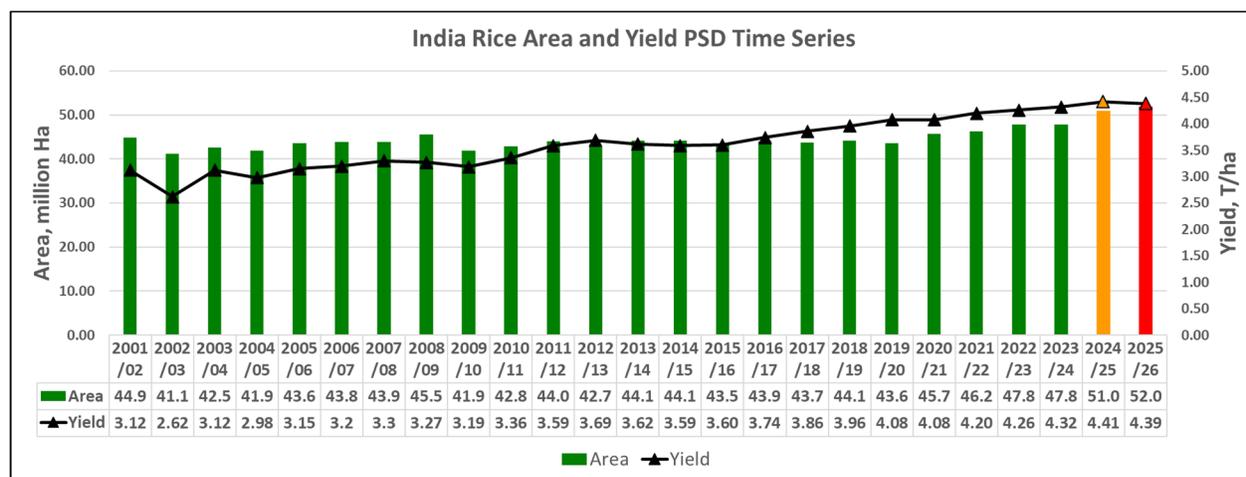

Nigeria is the second largest corn producer in Africa, behind South Africa. Corn is planted in almost all administrative states and the optimal window for planting corn in the major corn producing states is from May through June. The late arrival of seasonal rains from May through June caused many farmers to plant late or to reduce their corn area planting intentions. Satellite-derived Normalized Difference Vegetation Index (NDVI) measurements confirm late crop establishment by early July, but rains improved for the remainder of the growing season and cropland NDVI values indicate corn yields slightly above the 5-year average and similar to last year.

Annual Wet Season Agricultural Performance surveys from 2009 through 2024 were recently published by the Federal Ministry of Agriculture and Rural Development, National Agricultural Extension and Research Liaison Services and these surveys provide annual crop production, area, and yield estimates for each state for the past fifteen years. *(For more information, please contact [Curt.Reynolds@usda.gov](mailto:Curt.Reynolds@usda.gov).)*

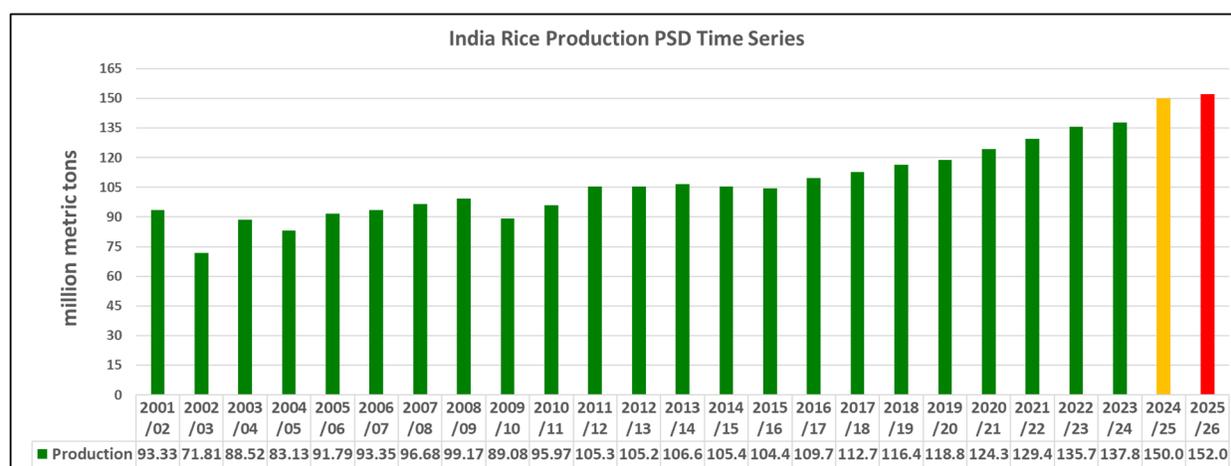

## India Rice: Record Area Leads to Record Production

USDA estimates India rice production for marketing year (MY) 2025/26 at a record 152.0 million metric tons (milled basis), up 1 percent from last month and 1 percent from last year. Harvested area is estimated at a record 52.0 million hectares (mha), up 1 percent from last month, up 1 percent from last year and 9 percent above the 5-year average. The yield (rough basis) is estimated at a record 4.39 tons per hectare, down less than 1 percent from last month, but up less than 1 percent from last year and up 3 percent above the 5-year average.

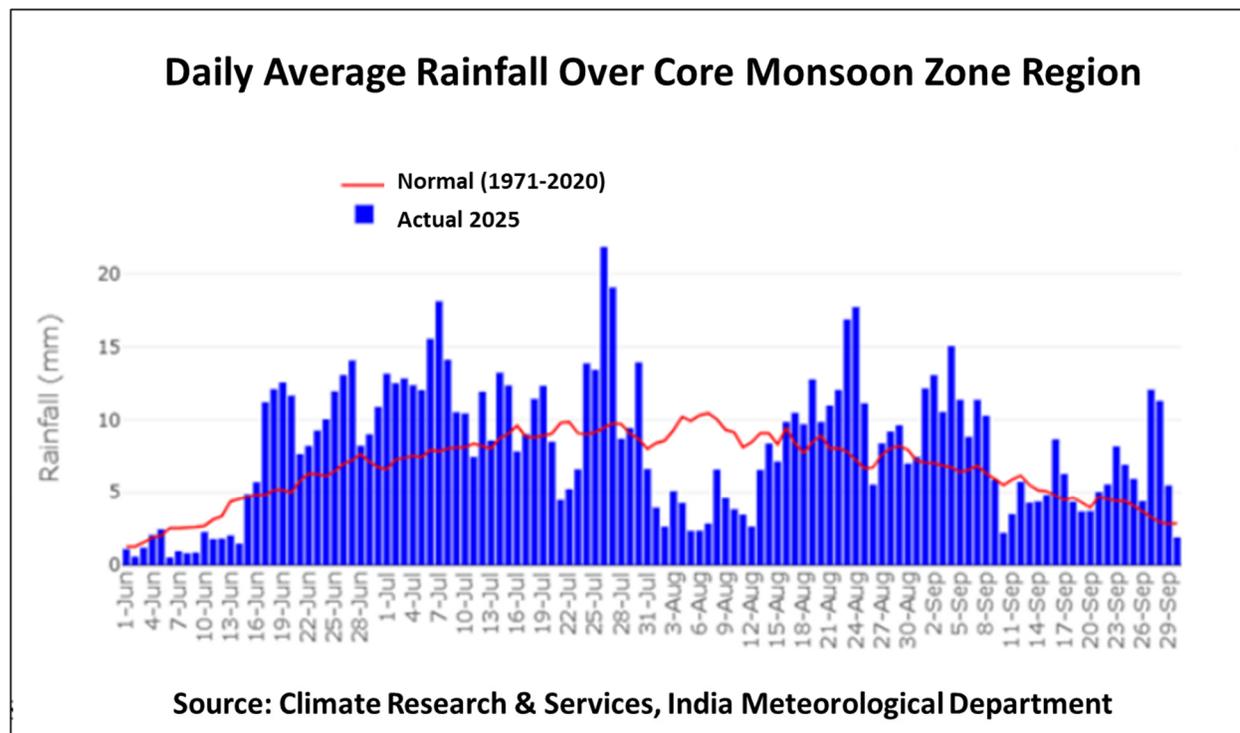

Source: USDA PSD Online

The record production is due to an increase in planted area and ideal in-season growing conditions as verified by satellite imagery analysis. Farmers were drawn to shift from cotton to rice due to its potential for higher yields and less risk than cotton. The India's Ministry of Agriculture recently reported *kharif* rice planted area up almost 2 mha from the same time the previous season and higher than the 5-year average. According to FAS/New Delhi, planted area increased for rice, maize, and sugarcane, while oilseeds, cotton, and pulses declined.

Source: USDA PSD Online

India rice is produced in two primary seasons, *kharif* (spring-summer) and *rabi* (winter). *Kharif* planting is from May to August, harvested from September to January, and *rabi* rice is planted from December to February and harvested from March to May. According to the Government of India, *kharif* accounts for 83 percent of total production, *rabi* for 10 percent, and most of the remaining 7 percent is for a summer crop, with a smaller crop in between.

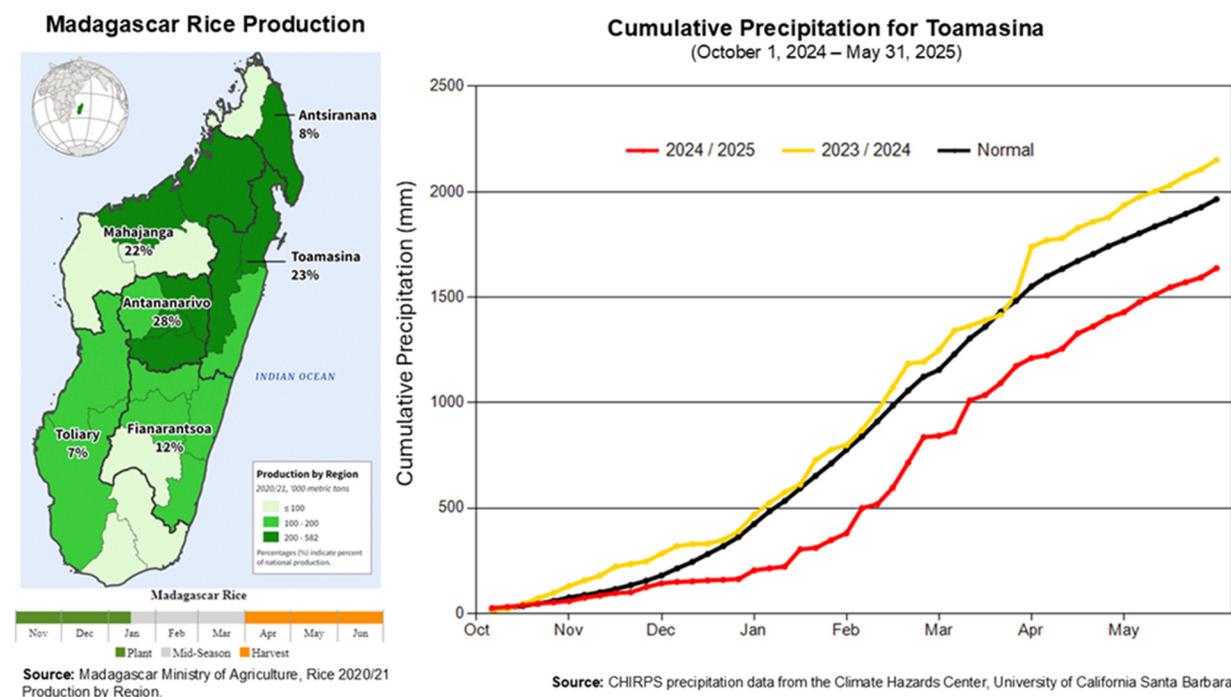

The planted rice benefited from the favorable southwest monsoon rains during planting, coupled with the late withdrawal of the monsoon, leading to favorable precipitation in late August and September. According to the India Meteorological Department, India received 937.2 millimeters (mm) of rainfall during the southwest monsoon season (June 1 to September 30), surpassing the normal of 868.6 mm by eight percent. According to FAS/New Delhi, reservoir storage remained strong at over 91 percent of capacity, ensuring good water availability for the upcoming *rabi* (winter) season. (For more information, please contact [Dath.Mita@usda.gov](mailto:Dath.Mita@usda.gov).)

## Madagascar Rice: Production Down Sharply from Last Year's Record Crop

USDA estimates Madagascar rice production for marketing year (MY) 2025/26 at 2.7 million metric tons (milled basis), down 26 percent from last month, down 19 percent from last year's record crop, and down 12 percent from the 5-year average. Harvested area is estimated at 1.8 million hectares, down 8 percent from last year, and down 6 percent from the 5-year average. Yield (rough basis) is estimated at 2.40 metric tons per hectare, down 12 percent from last year, and down 7 percent from the 5-year average. Total harvested area and yield were below average due to several prolonged dry spells from November through March occurring in the main producing regions located in the eastern and northern half of the country.

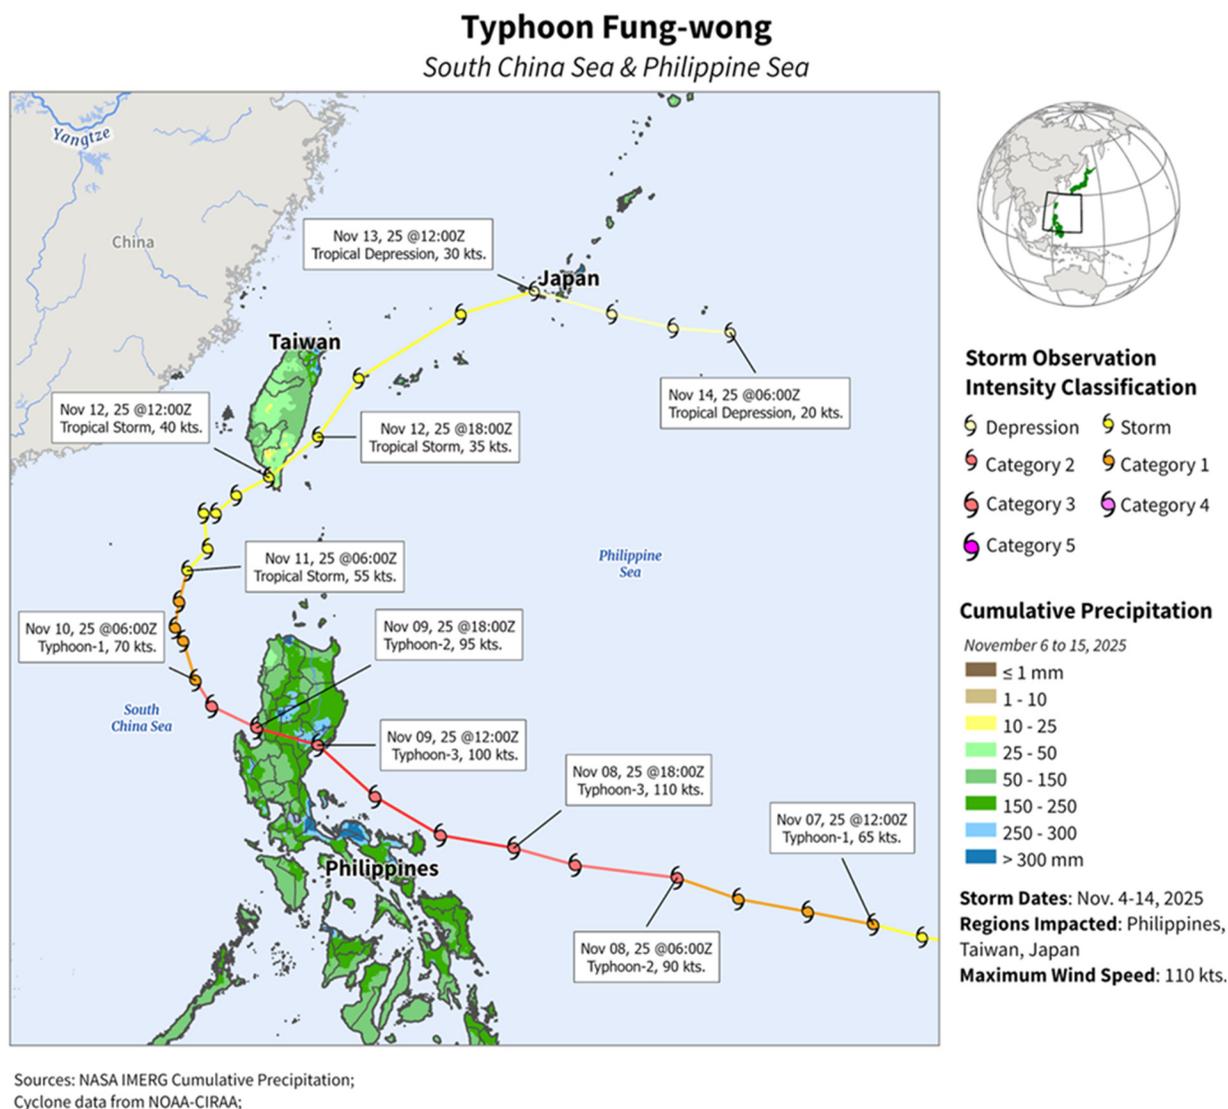

Rice in Madagascar is planted during November through mid-January and harvested from April through June. Seasonal rains were delayed, which reduced crop emergence, lowered planted area, and reduced yield potential from a shortened growing season. In addition, crop prospects were lowered due to a mid-season dry spell during March and higher-than-average temperatures throughout the season, with the final MY 2025/26 yield being the lowest reported yield in the past 20 years.

Madagascar is the third largest rice producer in Africa, behind Nigeria and Egypt. Rice is planted in almost all administrative zones in Madagascar and rice is the main subsistence crop grown. Approximately 80 percent of Madagascar's rice area is irrigated. Madagascar's government has set a goal to increase rice production and achieve self-sufficiency by improving the supply of inputs, introducing better crop management practices and varieties, increasing technical extension support, and rehabilitating irrigation infrastructure. (For more information, please contact [Curt.Reynolds@usda.gov](mailto:Curt.Reynolds@usda.gov).)

## Philippines Rice: Untimely Typhoon Rains Reduce Production

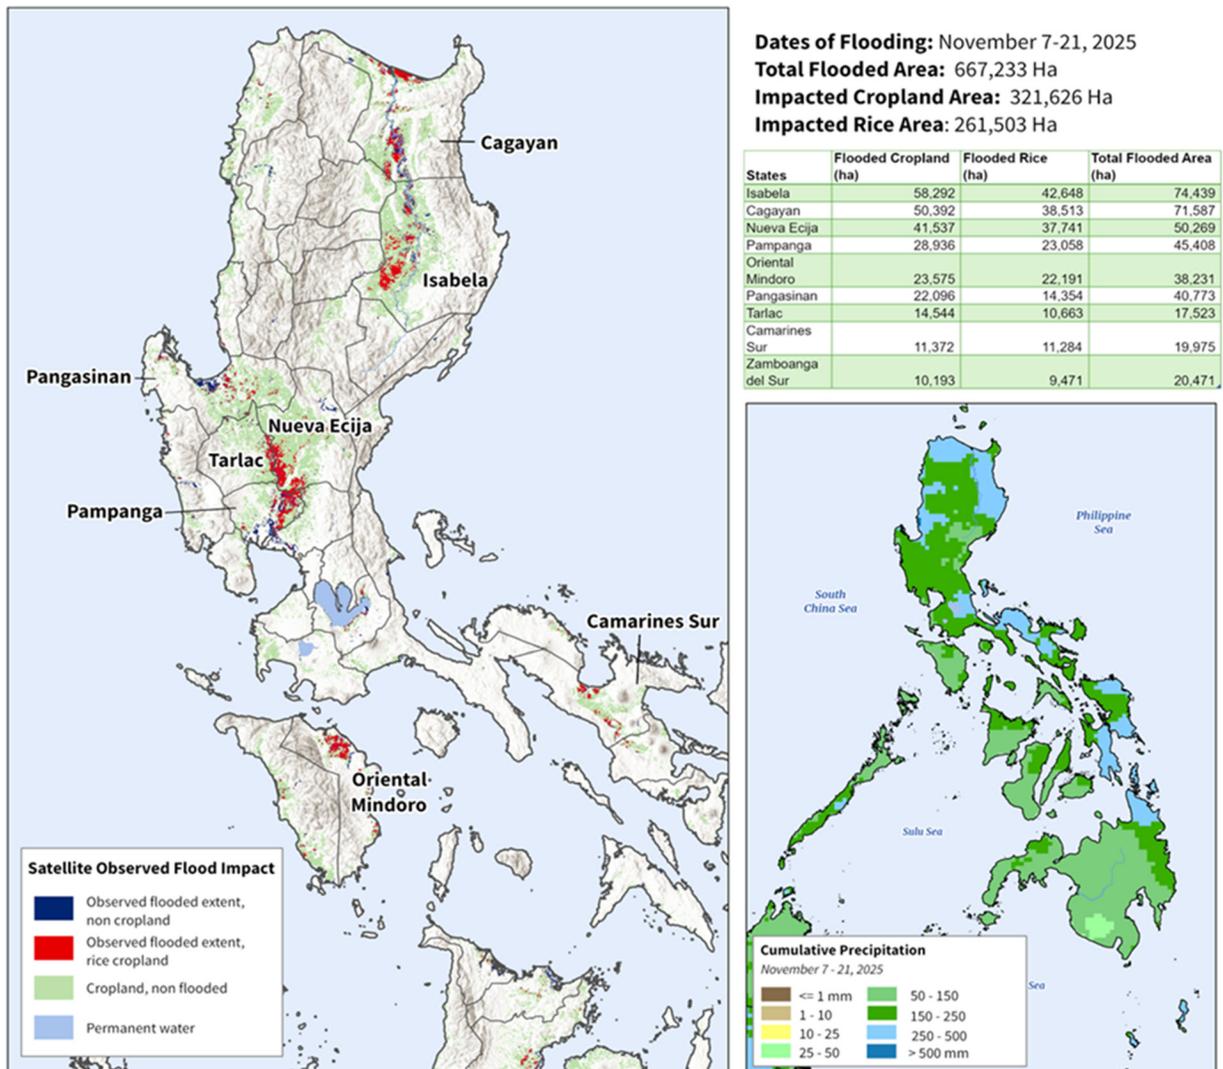

USDA estimates marketing year (MY) 2025/26 Philippines rice production at 12.3 million metric tons (milled basis), down 2 percent from last month and 1 percent from last year. Harvested area is estimated at 4.7 million hectares, down 2 percent from last month and less than 1 percent from last year. Yield (rough basis) is estimated at 4.15 tons per hectare, down less than 1 percent from last month and 1 percent from last year.

After a good start to the Philippines rice crop season, which led to well above-average production estimates, untimely rain fell in early to mid-November stemming from Typhoon Fung-wong. Torrential rains led to localized flooding in the northern Philippines major rice producing provinces, most notably, Central Luzon and the Cagayan Valley. Combined, these two regions account for roughly a third of the Quarter four rice output. Quarter four rice harvest period began in October and extends through December. Local reports indicated widespread flooding across the region that led to rice fields being inundated. Remotely-sensed flood analysis validated the extent of flooded rice fields. Early analysis indicated more than 250,000 hectares of rice fields flooded.

Though rice is a hardy crop and can withstand short periods of flooding, area and yield impacts are more probable during extended periods of inundation. Additionally, yield potential can be impacted based on the rice crop stage. Due to the advanced stage of the rice crop at the time when the rainfall event occurred, yield for Quarter four rice is estimated to decline.

### Northern Philippines: Flood Impact

Sources: NOAA/NESDIS VIIRS 5-Day Flood Composite (November 13-17, 2025); ESA Worldcover 10m 2021 Crop Mask; NESEA-Rice10 10m 2017-2019 Rice Dataset IMERG Cumulative Precipitation (November 7-21, 2025); Flood extent defined as pixels containing 40% or greater flooding for the period Date Range.

Rice in the Philippines is cultivated throughout the year and is reported quarterly. USDA’s marketing year begins with the third quarter, July through September. The highest rice outputs are produced in Quarters four and one, which represent about 38 and 23 percent of total production, respectively. (For more information, please contact [Justin.Jenkins@usda.gov](mailto:Justin.Jenkins@usda.gov).)

World and Selected Countries and Regions

**TABLE 18**

The table below presents a record of the December projection and the final estimate. Using world wheat production as an example, the "root mean square error" means that chances are 2 out of 3 that the current forecast will not be above or below the final estimate by more than 0.8 percent. Chances are 9 out of 10 (90% confidence level) that the difference will not exceed 1.3 percent. The average difference between the December projection and the final estimate is 4 million tons, ranging from 0.4 million to 10.2 million tons. The December projection has been below the estimate 33 times and above 11 times.

**RELIABILITY OF PRODUCTION PROJECTIONS 1/**

1/ Marketing years 1981/82 through 2024/25 for grains, soybeans, and cotton. Final for grains, soybeans, and cotton is defined as the first November estimate following the marketing year for 1981/82 through 2023/24, and for 2024/25 the last month's estimate.

2/ Includes corn, sorghum, barley, oats, rye, millet, and mixed grain
